

**With the Benefit of Hindsight  
An Analysis of Loss Reserving Methods**

Prepared for: International Congress of Actuaries  
Washington, D.C.

---

---

---

---

---

---

---

---

**Overview**

- § Scope of Review
- § The Methods
- § The Metric
- § Results
  - Development Age
  - Line of Business
  - Company Size
- § How Useful Are These Results?
  - Correlation
  - Significance
- § Conclusions

3

---

---

---

---

---

---

---

---

**SCOPE OF REVIEW**

4 

---

---

---

---

---

---

---

---

**Scope of Review**

- § 3,110 Companies
- § 16 Lines of Business
- § 14 Evaluations (Excluding 2010)
- § 30 Methods

§ Hindsight Indications

- 20.9 Million In Theory
- 4.9 Million In Fact

5 

---

---

---

---

---

---

---

---

**THE METHODS**

6 

---

---

---

---

---

---

---

---

**Methods – Chain Ladder**

- § Standard Chain Ladder
  - § Paid
  - § Incurred
  - § Case Reserve
- § Berquist-Sherman (Case Adjustment)
- § Munich Chain Ladder
  - § Paid
  - § Incurred

7 

---

---

---

---

---

---

---

---

**Methods – Incremental**

- § Incremental Additive
  - § Paid
  - § Incurred
  - § (Normalized using net earned premium)
- § Incremental Multiplicative
  - § Paid (paid on prior paid)
  - § Incurred (incurred on prior incurred)
- § Backward Recursive
  - § Paid on prior case / case on prior case

8 

---

---

---

---

---

---

---

---

**Methods – Least Squares**

- § Brosius
  - § Paid
  - § Incurred
- § Weighted Brosius
  - § Paid
  - § Incurred

9 

---

---

---

---

---

---

---

---

**Methods – Count-Based**

- § Frequency / Severity
- § Hindsight Outstanding – Unpaid
  - § Average unpaid loss per yet to close claim
- § Hindsight Outstanding – IBNR
  - Average IBNR loss per yet to close claim
- § Claims Closure
  - § Projection of claims to close by development period
  - § Paid loss per yet-to-close claim

10 

---

---

---

---

---

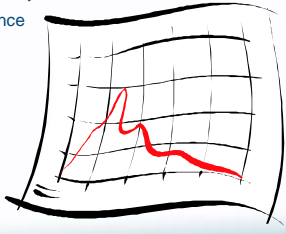

---

---

---

**Methods – Loss Ratio**

- § Industry-Based
  - § AM Best projections of accident year loss ratios
- § Based on Company Experience
  - § All prior years
  - § Three prior years

11 

---

---

---

---

---

---

---

---

**Methods – Composite**

- § Bornhuetter-Ferguson
  - § Industry loss ratio
    - § Paid
    - § Incurred
  - § Method-based prior years' loss ratio
    - § Paid
    - § Incurred
- § Benktander
  - § Paid
  - § Incurred
- § Cape Cod
  - § Paid
  - § Incurred

12 

---

---

---

---

---

---

---

---

**THE METRIC**

13 

---

---

---

---

---

---

---

---

**The Metric: "Method Skill"**

§ Error = Indicated Unpaid Ratio to Premium  
– Hindsight (HS) Unpaid Ratio to Premium

§ Anomaly = Hindsight Unpaid Ratio to Premium  
– Wtd Avg HS Unpaid Ratio to Premium

§ Weighted average is across accident/report years

§ Observations:  
– Anomaly is a property of the data  
– Error is a property of the method

14 

---

---

---

---

---

---

---

---

**Method Skill**

§ Skill =  $1 - \frac{\text{Mean Squared Error}}{\text{Mean Squared Anomaly}}$

§ Mean is measured across accident/report years

§ Observations:  
– Maximum Skill = 1  
– No minimum  
– It's all relative

15 

---

---

---

---

---

---

---

---

### Skill – Advantages and Disadvantages

§ Advantages

- Provides a single number
- Allows for normalization across different insurers
- Calculation has a "credibility" adjustment for % paid

§ Disadvantages

- Does not address bias
- What does skill mean in \$?

16

---

---

---

---

---

---

---

---

### Incurred Chain Ladder Method Median Skill Across All Lines of Business

17

---

---

---

---

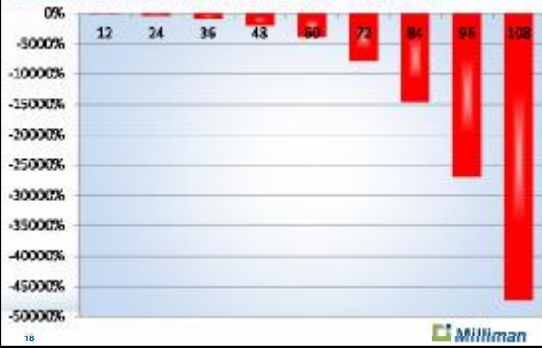

---

---

---

---

### Industry Loss Ratio Method Median Skill Across All Lines of Business

18

---

---

---

---

---

---

---

---

**THE RESULTS**

19 

---

---

---

---

---

---

---

---

**Results**

§ Development Age  
– Months of Development 12 through 108

§ Line of Business  
– All Schedule P lines

§ Company Size  
– Small (\$4.2M avg 2010 net annual premium)  
– Medium (\$17.5M avg premium)  
– Large (\$350M avg premium)

20 

---

---

---

---

---

---

---

---

**Best Performers  
Mature Evaluations**

1. Hindsight IBNR
2. Backward Recursive
3. Incremental Additive – Incurred
4. Bornhuetter-Ferguson – Incurred (Industry Loss Ratio)
5. Case Reserve Chain Ladder

21 

---

---

---

---

---

---

---

---

**Best Performers  
Early Evaluations**

1. Bornhuetter-Ferguson – Incurred (Industry Loss Ratio)
2. Benktander – Incurred
3. Incremental Additive – Incurred
4. Cape Cod – Incurred
5. Bornhuetter-Ferguson – Incurred (Prior Years' Loss Ratio)

22

---

---

---

---

---

---

---

---

**Worst Performers  
Mature Evaluations**

30. Frequency / Severity
27. Loss Ratio (All Three Versions)
25. Weighted Brosius – Paid & Incurred
23. Brosius – Paid & Incurred
22. Incremental Multiplicative – Paid

23

---

---

---

---

---

---

---

---

**Worst Performers  
Early Evaluations**

30. Frequency / Severity
27. Loss Ratio (All Three Versions)
25. Weighted Brosius – Paid & Incurred
24. Claims Closure
23. Incremental Multiplicative – Paid

24

---

---

---

---

---

---

---

---

### Observations on the Best Performers

§ Rely at least in part on case reserves

§ Paid does not directly impact unpaid  
 - (Small impact in Benktander and Cape Cod)

§ Only one in common use  
 - Bornhuetter-Ferguson

25

---

---

---

---

---

---

---

---

### Median Skill – All Lines of Business

26

---

---

---

---

---

---

---

---

### Median Skill – All Lines of Business

27

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

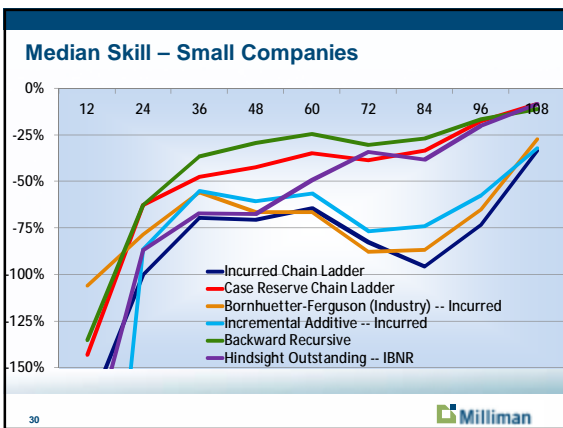

---

### Initial Conclusion

§ Several methods outperform incurred chain ladder:

- Bornhuetter-Ferguson – Incurred
- Benktander – Incurred
- Backward Recursive
- Case Reserve Chain Ladder
- Hindsight Outstanding – IBNR
- Incremental Additive – Incurred

§ So should we be using these methods?

- How significant is the improvement?
- Do we really need all of these methods?

32

---

---

---

---

---

---

---

---

### CORRELATION

33

---

---

---

---

---

---

---

---

### Median Skill – All Lines of Business Logarithmic Scale

---

---

---

---

---

---

---

---

---

---

### Correlation – Observations

- § The less correlated two methods are, the greater the skill of an average of those methods
- § Ideal weighting will depend on
  - Correlation
  - Individual method skill
- § Also important: lack of bias in methods

---

---

---

---

---

---

---

---

---

---

### Average Correlation with Incurred Chain Ladder Best Methods – All Lines of Business

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**SIGNIFICANCE**

40 

---

---

---

---

---

---

---

---

**How Significant Is An Increase in Skill?  
Example**

- § 2010 Earned Premium of \$60 Million
- § Wtd Avg HS Unpaid Ratio @ 6<sup>th</sup> Report = 10%
- § HS Unpaid Ratio Ranges from 2% to 31%
- § Anomaly Ranges from -8% to 21%
- § Mean Squared Anomaly = 0.4%

41 

---

---

---

---

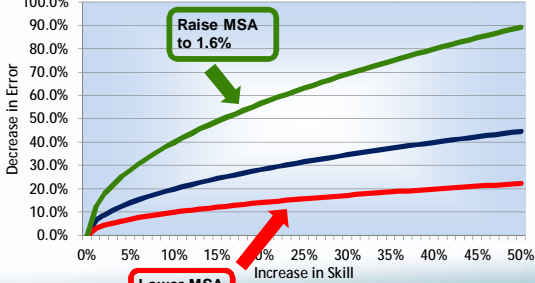

---

---

---

---

**How Significant Is An Increase in Skill?  
Example**

Increase in Skill (%)	Decrease in Error (%) - MSA 1.6%	Decrease in Error (%) - MSA 0.4%	Decrease in Error (%) - MSA 0.1%
0%	0%	0%	0%
5%	~15%	~10%	~5%
10%	~35%	~18%	~8%
15%	~50%	~25%	~10%
20%	~65%	~30%	~12%
25%	~75%	~35%	~14%
30%	~82%	~38%	~15%
35%	~87%	~40%	~16%
40%	~90%	~42%	~17%
45%	~92%	~43%	~18%
50%	~93%	~44%	~18%

42 

---

---

---

---

---

---

---

---

**CONCLUSIONS**

43 

---

---

---

---

---

---

---

---

**Conclusion #1: Consider Different Methods**

44 

---

---

---

---

---

---

---

---

**Conclusion #2: Consider Different Weights**

45 

---

---

---

---

---

---

---

---

## Questions?
